

Viagra

Pfizer pharmaceuticals have been providing ED-treatment that is highly effective and health-friendly since 1998. The Viagra has become popular among every happy couple in today's strenuous life. It is known popularly by the name of blue pill these days while its sales are getting higher and higher despite the growing competition in the modern pharmacy.

Primarily, the drug acts to indulge in the enzymatic action of one an enzyme from the PDE family. PDE type 5 is inhibited by the drug leading to inhibited degradation of cGMP in the penile tissues. The drug travel via blood to the penile blood vasculature with further dilates to make more room for increased blood supply. Viagra, as a PDE5 inhibitor, protect a potent smooth muscle dilator of penile blood vessels to cause rapid filling of penis with blood for erection to achieve instantaneously.

Dizziness and flushing are most frequently seen side effects apart from visual and hearing problems that often ensue. Dyspepsia and nasal congestion are other side effects. Take the drug half and hour before sexual interaction the effects of which are expected to last as long as four hours of erection of satisfactory level. Make sure you do not get any other medications that contain nitrates or other vasodilators to avoid hypotension and eventually a circulatory collapse. Also, erythromycin is to be avoided along with Viagra use. Do not use it more than once in 24 hours. Do not take too much alcohol or dizziness might aggravate or cause sexual stimulation difficult to achieve. Our online pharmacy could be the most convenient quality pharmacy from where you could order you wonder drug to be delivered in no time.
